

Pet Interaction Game Plan

Overview

KOKOBOX is designed as a pet companion experience inside a WeChat Mini Program. The game is not built as a single isolated mini game. Instead, it is a daily interaction loop where the pet, the user, the town, chat, tasks, and mini games all reinforce one another.

The goal is to make the pet feel alive, responsive, and worth returning to every day. Players should be able to care for Koko, play quick games, chat with it, and see the world react to their progress.

Design Goals

- Make the pet feel emotionally present, not just decorative.
- Keep interactions short, readable, and friendly for mobile use.
- Turn simple taps and gestures into meaningful pet responses.
- Connect gameplay rewards to care, progress, and social presence.
- Keep the experience lightweight enough for WeChat Mini Program constraints.

Core Experience

The core loop is:

1. Check in with Koko.
2. Complete a small interaction such as chat, care, or a mini game.
3. Earn feedback, progression, or a small reward.
4. Return later to continue the relationship.

The interaction design should always answer three questions for the player:

- What can I do now?
- How does Koko respond?
- Why should I come back later?

Interaction Pillars

1. Direct Pet Interaction

Koko should respond to touch, voice, and UI actions in a way that feels immediate.

Examples:

- Tapping the pet triggers animation or dialogue.
- Holding or tapping a control starts a voice interaction.
- Quick replies produce short pet reactions.
- The pet reacts differently depending on mood, context, or progress.

2. Mini Games as Care Moments

Mini games are not meant to replace the pet experience. They are designed as playful care activities that strengthen the bond with Koko.

Current game directions:

- Catch: help Koko catch falling objects with quick taps.
- Bubble Pop: tap and pop bubbles that Koko creates.
- Future games can extend the same pattern with simple gestures and short rounds.

3. Town and Social Presence

The town area gives Koko a world beyond the private pet page. It creates a sense of place, community, and shared activity.

This supports:

- Invite sharing.
- Co-op friend presence.
- Friendly greetings and town guide interactions.
- A stronger identity for Koko as a companion in a shared world.

Game Structure

Session Length

Each interaction should fit a mobile micro-session.

Recommended target:

- 10 to 30 seconds for a single micro interaction.
- 1 to 2 minutes for a full visit.
- 3 to 5 minutes for a focused play session.

Difficulty Model

The game should stay accessible first and competitive second.

Principles:

- The first interaction should be easy enough to understand immediately.
- Difficulty should ramp gradually through speed, timing, or quantity.
- Failure should feel soft and encouraging rather than punishing.
- Rewards should favor participation and consistency.

Rewards

Rewards should support the companion fantasy.

Good reward examples:

- Affection or mood changes.
- Cosmetic feedback such as animation, reactions, or status changes.
- Progress toward daily routines or care goals.
- Small in-world feedback in the town or profile view.

Pet Personality

Koko should not feel like a generic mascot. Its personality should be visible in all interactions.

Personality traits:

- Friendly and reactive.

- Playful but calm.
- Encouraging when the player returns.
- Slightly expressive in success and failure states.

The pet voice and text should stay warm, concise, and supportive. Messages should feel like a companion speaking, not a system notification.

Visual Direction

The visual language should support softness, clarity, and motion.

Key rules:

- Keep the pet large enough to feel central.
- Use readable UI layers around the pet instead of overloading the screen.
- Animate the pet with small emotional changes, not constant noise.
- Use backgrounds and panels to frame the interaction space.

Important visual moments:

- Idle state.
- Start state.
- Active gameplay state.
- Success state.
- End state.

Audio and Feedback

Audio should reinforce actions without becoming distracting.

Possible feedback channels:

- Light sound effects for taps and pops.
- Voice or speech-style responses for chat moments.
- Animated feedback for success, combo, or attention moments.
- Gentle failure feedback that still keeps the mood positive.

The system should always provide at least one clear response after a player action.

UX Principles

The interaction design should follow these rules:

- One primary action per screen.
- No confusing control density.
- Short loading and transition states.
- Clear recovery when permissions or cloud data are unavailable.
- Mobile-first layouts with large tap targets.

The experience should avoid forcing the player to learn complex rules before feeling the pet relationship.

Technical Constraints

Because the product targets WeChat Mini Program, the game plan must stay practical.

Constraints to respect:

- Keep asset sizes light.
- Support cloud fallback behavior when data is unavailable.
- Preserve compatibility with native WeChat UI and sharing flows.
- Avoid overly heavy animation or rendering patterns.
- Make sure interactions still work when network state is unstable.

Extensibility

The current design can expand without breaking the core loop.

Future directions:

- New mini games with the same short-session format.
- More emotional states for Koko.
- Town-based cooperative activities.
- Better long-term progression and collection systems.
- More personalized reactions based on user history.

Success Criteria

The interaction game is successful when:

- Players understand what to do within seconds.
- Koko feels responsive and emotionally consistent.
- Mini games feel like part of the companion experience.
- Returning users notice progress and stronger feedback.
- The experience remains smooth inside WeChat Mini Program limits.

Summary

Pet Interaction Game Plan is about building a companion loop rather than a standalone game. The design focuses on small interactions, expressive feedback, and a world that makes Koko feel present every day. Mini games, chat, town, and care systems all exist to support one idea: the pet should feel worth returning to.
